

Improving Patient Outcomes

MDdatacor offers a quality measurement solution that provides:

Access to Superior Clinical Data

MDdatacor collects clinical and claims data from providers via *any* electronic medical record (EMR), practice management, lab and registry systems into a secure, HIPAA-compliant database. Providers may also use a web portal for direct data entry.

What makes MDdatacor unique is proprietary technology that extracts clinical data from unstructured sources, such as transcription notes. Access to transcription notes results in much richer clinical data.

The ability to accept direct data entry and transcription notes means that MDdatacor can work with providers that do not have an EMR or other automated systems.

Care Opportunity Reports

After collecting and analyzing the patient data, MDdatacor generates real-time Care Opportunity reports, identifying patients whose current treatment isn't meeting established guidelines. Clinicians have convenient access to this data anytime, from anywhere, through the Web-based Care Center portal.

Decision Support at the Point-of-Care

Physicians have access to individual patient data at the time of visit, such as clinical and lab values displayed in a historical trend graph. Patient summary reports detail a person's current medications, as well as diagnosis, procedure and contraindication history.

Access to this information allows the physician to make more informed decisions regarding treatment and achieve the best clinical outcome. Care teams have the ability to print all patient care summaries at the beginning of the day or upon patient check-in, increasing provider productivity.

Documentation of Outcomes

MDdatacor provides benchmarking data and clinical outcomes to illustrate ongoing improvement in patient care, in support of quality improvement and pay-for-performance programs.

MDdatacor gives physicians the ability to track their progress toward meeting the quality improvement goals, as well as compare their performance to other physicians in their practice and other physicians in the network. It can also be used to evaluate the performance of multiple providers within a group.

How Can MDdatacor Benefit You?

Enhanced Clinical Quality

- Actionable patient data at the point-of-care
- Improved decision support
- Better patient outcomes
- Reduced variability of care
- Greater patient satisfaction

Improved Productivity

- Eliminates manual chart reviews
- Quick and simple to get started
- Requires no change to current workflow
- Patient summaries can be printed and placed in charts for all patients to be seen that day

Increased Financial Profitability

- Revenue from increased patient visits
- Supports physicians in pay-for-performance programs
- Documentation can be used to support reimbursement
- Identify patients for clinical trials

Unmatched Flexibility

- Access over the Web – no hardware or software to buy
- Easy data collection from any source
- Use evidence-based guidelines or customize protocols
- Custom reports available
